AVINASH | DASHBOARD AND USER JOURNEY

Meeting purpose

Monday and Tuesday establish the existing dashboard baseline and the API contract. The full Streamlit screens are planned for Wednesday and Thursday, so present current pages and gaps accurately.

Suggested meeting script

"I reviewed the existing dashboard modules and the API documentation to map the user journey and identify missing screens. The dashboard gets campaign facts from the REST API; it should not read CSVs, PDFs, or the database directly, and it should not duplicate backend clearance rules.
I will use the ordered API flow as the contract for the UI."

What to explain and show

- Why: keep one trusted source for campaign facts and business rules.
- What: inspected API client, queue, detail, decision queue, audit, and chat modules; list any changed files and the reason for each change.
- How: walk through the API journey, mark existing screens and gaps, and show the API-backed page inventory.

Inputs -> outputs

Inputs: API base URL, authenticated session token, and API JSON responses for queue, campaign detail, clearances, decisions, audit, and chat.
Outputs: dashboard pages for queue/detail, decisions, audit, and chat; visible loading, error, and role-aware states as appropriate.

FILES AND DEMO

Dashboard files

Project/dashboard/api_client.py
Project/dashboard/audit_trail.py
Project/dashboard/campaign_detail.py
Project/dashboard/clearance_chat.py
Project/dashboard/clearance_queue.py
Project/dashboard/decision_queue.py
Project/run_dashboard.py
Project/API_DOCUMENTATION.md
Project/TEST_API_EXAMPLES.md

Ordered API journey

Sign in -> queue -> campaign detail -> create assessment -> pending clearances -> assessment detail -> model calls -> second controller sign-in -> decision -> final detail -> audit -> chat.

Run from Project (API in another PowerShell window)

```
python -m uvicorn api.routes:service_application --host 127.0.0.1 --port 8000
python -m streamlit run dashboard/clearance_queue.py
```

Use TEST_API_EXAMPLES.md and Swagger at /docs to demonstrate the endpoint sequence. Explain which pages exist and which remain planned.

Presentation tip

Show the API response behind a page and how the UI presents it. Avoid claiming missing screens are complete; show the gap board and next step.
