KARTHIGA | MONDAY WORK AND DEMO

Purpose

Monday is a baseline review: understand the existing data cleaning and model training flow, identify gaps, and avoid rebuilding components that already exist. Be clear about what the Monday commit actually changed; describe inspection/documentation separately from code edits.

Suggested meeting script

"I reviewed the project's existing data preparation and modeling flow to establish what was already in place before we make changes. I traced how supplied CSV data becomes cleaned datasets and model artifacts, and noted gaps that could affect the team. Monday was for understanding and documenting the current system, not building a duplicate pipeline."

What to explain

- What: reviewed data_pipeline and modeling modules plus the two run scripts.
- How: traced raw CSVs through cleaning, feature building, quality reporting, training, and artifact saving. If code was changed, point to each changed file and explain the fix.
- Why: give the team an accurate baseline and focus Tuesday's verification on real gaps.

Show this flow

Raw CSV files -> cleaning/features -> cleaned CSVs + quality report
-> model training -> saved models/schemas + metrics

Monday files reviewed

Project/data_pipeline/__init__.py, audience_cleaning.py, common_cleaning.py, dataset_loader.py, feature_builder.py, note_cleaning.py, quality_profiler.py, submission_cleaning.py; Project/modeling/_common.py, amendment_model.py, exposure_model.py, issue_model.py, model_evaluation.py, model_registry.py; Project/run_data_pipeline.py and Project/run_model_training.py.

INPUTS AND OUTPUTS

Data pipeline inputs - Project/data/

- campaign_submissions_train.csv
- campaign_submissions_eval.csv
- programme_audiences_train.csv
- programme_audiences_eval.csv
- clearance_notes.csv

Additional live service inputs - Project/data/input/

- booked_spots.csv
- open_campaign_notes.csv
- open_campaigns.csv
- programme_schedule.csv

These are used by the live queue/tools, not the five-file cleaning pipeline above.

Data pipeline outputs

Project/processed/campaign_submissions_train_clean.csv
Project/processed/campaign_submissions_eval_clean.csv
Project/processed/programme_audiences_train_clean.csv
Project/processed/programme_audiences_eval_clean.csv
Project/processed/clearance_notes_clean.csv
Project/output/data_quality_report.json

Model training outputs

Project/output/models/amendment_model.pkl
Project/output/models/amendment_features.json
Project/output/models/exposure_model.pkl
Project/output/models/exposure_features.json
Project/output/models/issue_model.pkl
Project/output/model_metrics.json

How to run after pasting changes

Open PowerShell in Project. For data-cleaning changes, run:

```
python run_data_pipeline.py
```

For modeling/training changes, regenerate data first, then train:

```
python run_data_pipeline.py
python run_model_training.py
```

Run the acceptance suite afterward:

```
python -m pytest ..\pytest\tests.py -q
```

If using the project virtual environment, activate it first:

```
.\.venv\Scripts\Activate.ps1
```

Demo commands (from Project)

```
Get-ChildItem processed
Get-Content output\data_quality_report.json
Get-ChildItem output\models
Get-Content output\model_metrics.json
```

Close: Monday's result is a documented baseline and gap list; Tuesday verifies and repairs the existing implementation. Show actual outputs and metrics from the current run.
