ROHAN | API, DATABASE AND AUTH

Meeting purpose

Present Monday as the project baseline and Tuesday as focused verification of API, database, and authentication behavior. Explain what was already implemented, what was checked or repaired, and show the API working.

Suggested meeting script

"I mapped the existing API, persistence, and authentication flow against the acceptance contract. I verified that seeded users can sign in, that their roles control which areas they can reach, and that the queue can be read through the authenticated API. My goal was to establish a working backend baseline and make focused repairs where behavior did not match."

What to explain and show

- Why: auth, role access, persistence, and API responses support the clearance flow and give the dashboard a stable contract.
- What: API routes/schemas, database models/repository, and permission and password handling; identify the exact files changed in the commit.
- How: seed the local database, start the service, sign in, authorize Swagger with the token, and request the queue.

Inputs -> outputs

Inputs: sign-in JSON, session-token header, API request parameters, and local SQLite database seeded from the supplied campaign data.
Outputs: session token, role-checked API responses, campaign queue, and persisted assessment, decision, audit, and chat records.

FILES AND DEMO

Files to name

Project/api/routes.py
Project/api/schemas.py
Project/persistence/database.py
Project/persistence/models.py
Project/persistence/repository.py
Project/access/password_security.py
Project/access/permissions.py
Project/run_database_setup.py
Project/run_api_service.py
Project/API_DOCUMENTATION.md

Run from Project in PowerShell

```
python run_database_setup.py
python -m uvicorn api.routes:service_application --host 127.0.0.1 --port 8000
```

Open http://127.0.0.1:8000/docs. Sign in with a seeded test user, authorize with the returned X-Session-Token, then call GET /queue. Example test accounts: tom / 22222222 (Executive), owen / 11111111 (Controller). Use different roles to demonstrate access boundaries.

Validation

```
python -m pytest ..\pytest\tests.py -q
```

Show the Swagger response and the test result. State which response or behavior each changed file was intended to fix.
